

DeskMail AI

User Guide

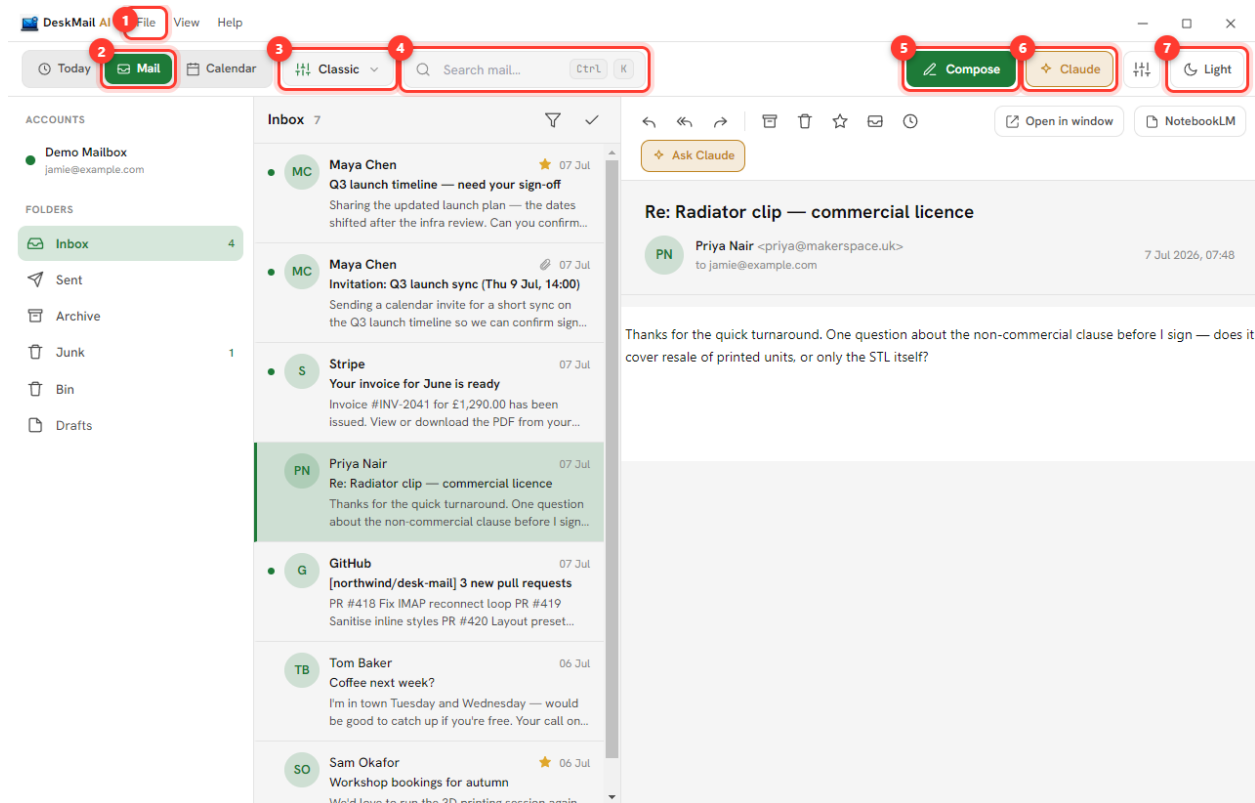

Getting set up and finding your way around your local email client.

What DeskMail AI is

DeskMail AI is your own desktop email client. It connects to your email account (IMAP/SMTP), keeps a copy of your mail locally so you can read it offline, and lets Claude help you search, draft and organise — all on this PC. Nothing is stored in the cloud by DeskMail; your mail and settings live on your machine.

1 · The main window

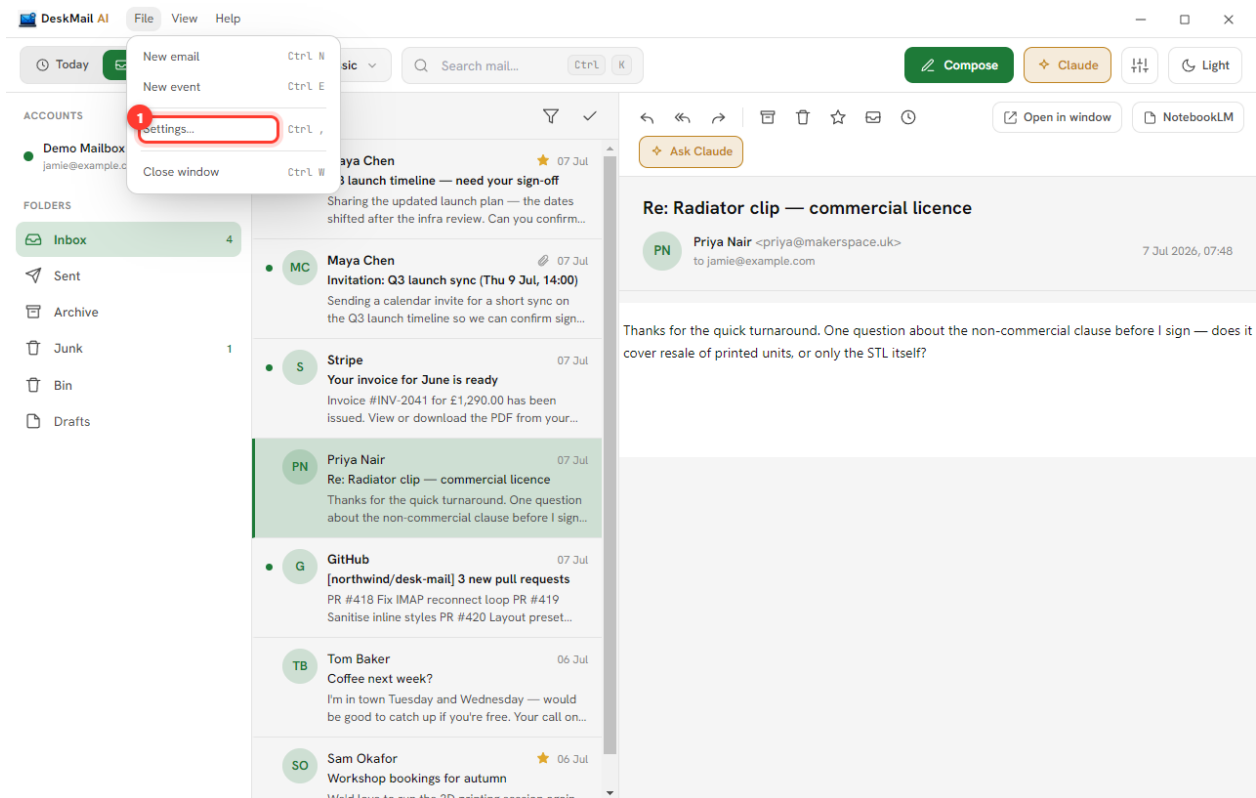

Everything is reachable from the bars along the top:

- 1 Menus — File, View, Help
- 2 Today / Mail / Calendar
- 3 Layout preset (window arrangement)
- 4 Search your mail
- 5 Compose a new message
- 6 Claude assistant panel
- 7 Light / Dark toggle

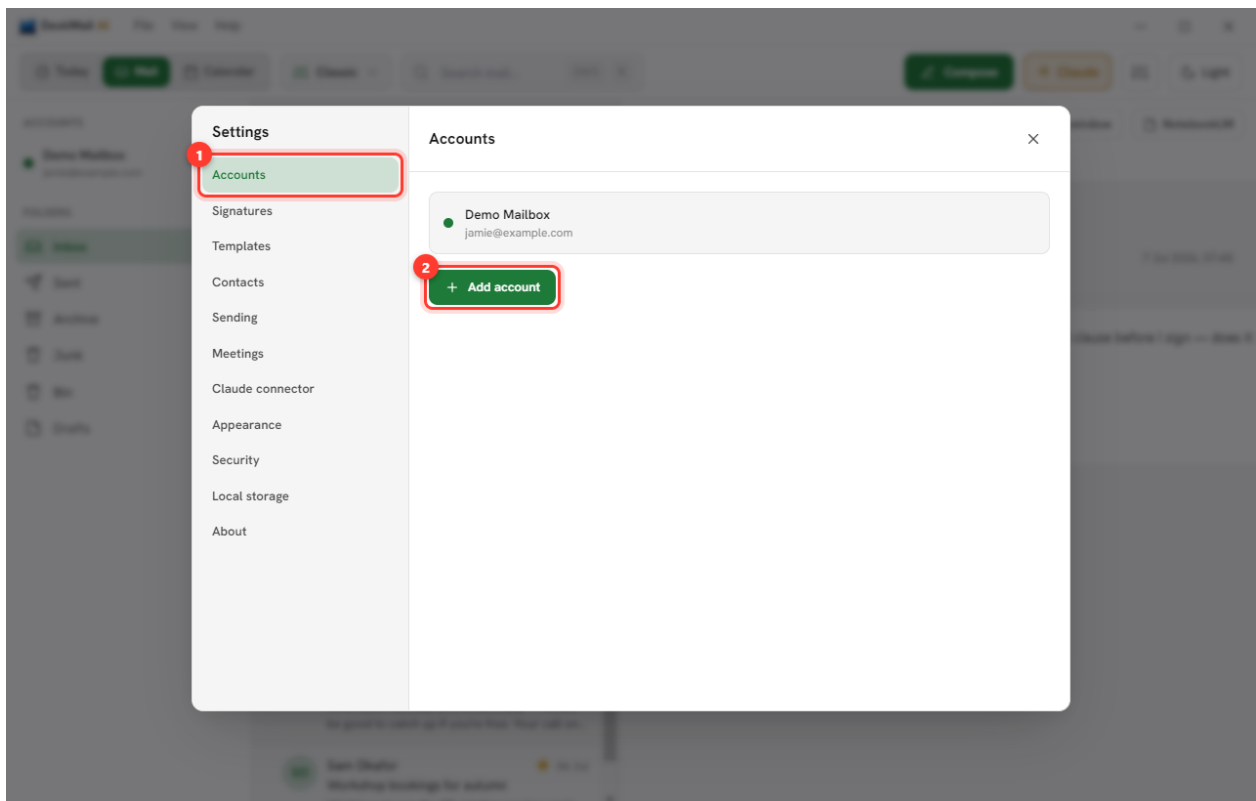

2 · Add your email account

Open the File menu and choose Settings.

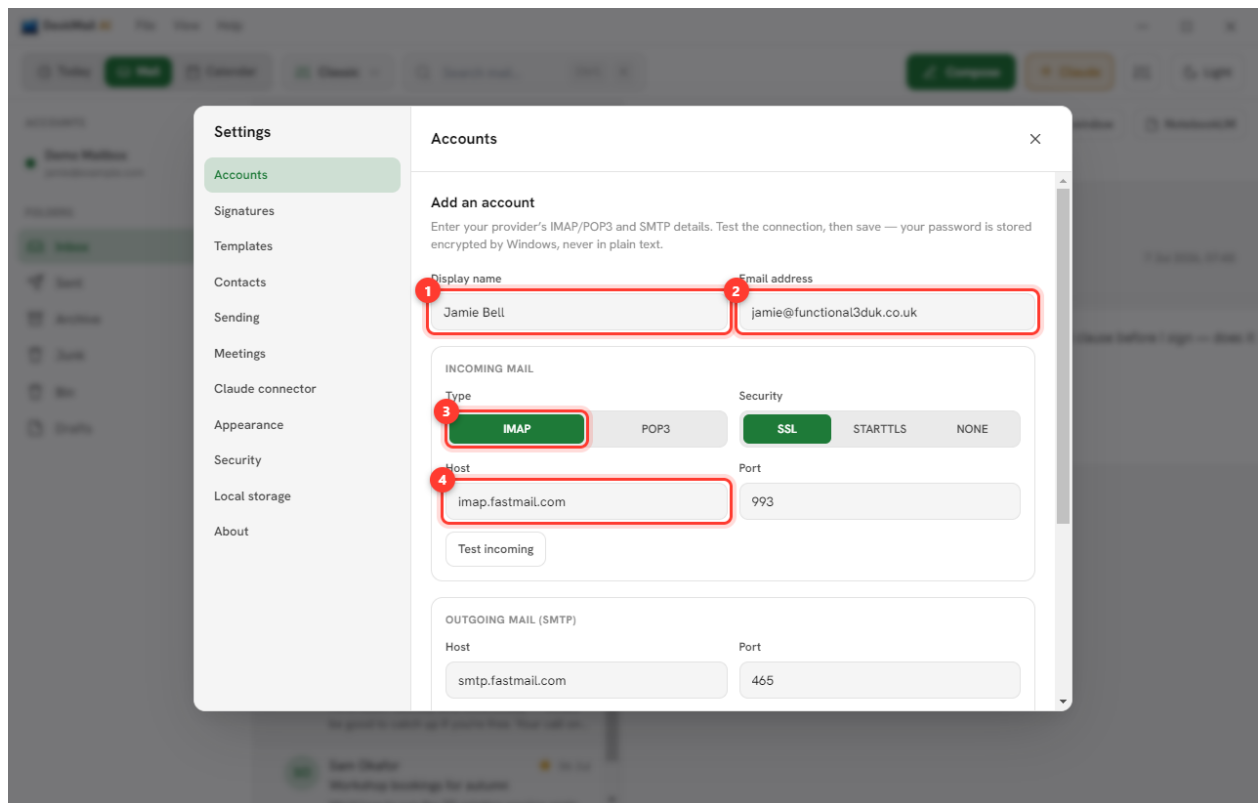

1 Open Settings

In Settings, the Accounts section is selected. Click “Add account”.

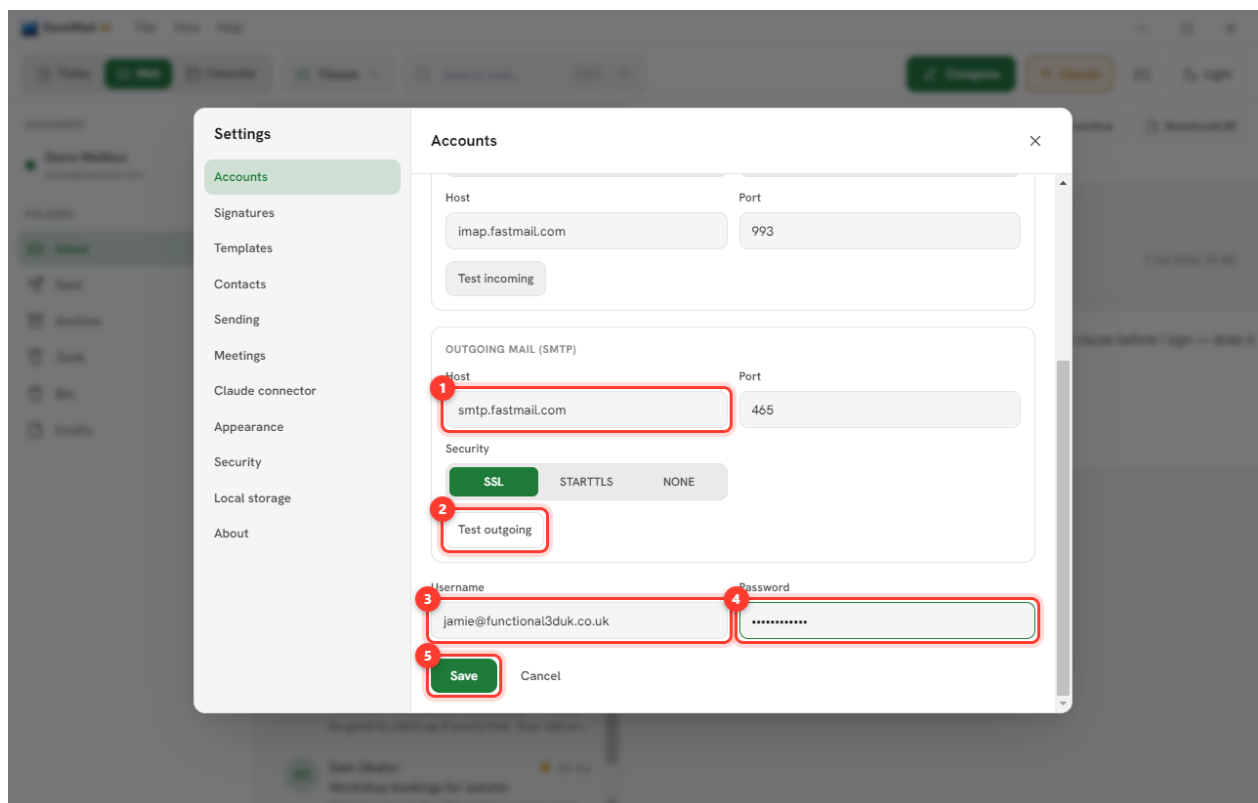

- 1 Accounts section
- 2 Add a new mailbox

Fill in your account details. Your provider publishes these as “IMAP and SMTP settings” — search e.g. “Fastmail IMAP settings” or “Gmail IMAP settings”. Typical incoming (IMAP) is port 993 / SSL; outgoing (SMTP) is 465 / SSL or 587 / STARTTLS.

- 1 Your display name
- 2 Your email address
- 3 Incoming type — IMAP (recommended) or POP3
- 4 Incoming server host + port + security

Scroll down for the outgoing server and your sign-in. Test both connections, then Save.

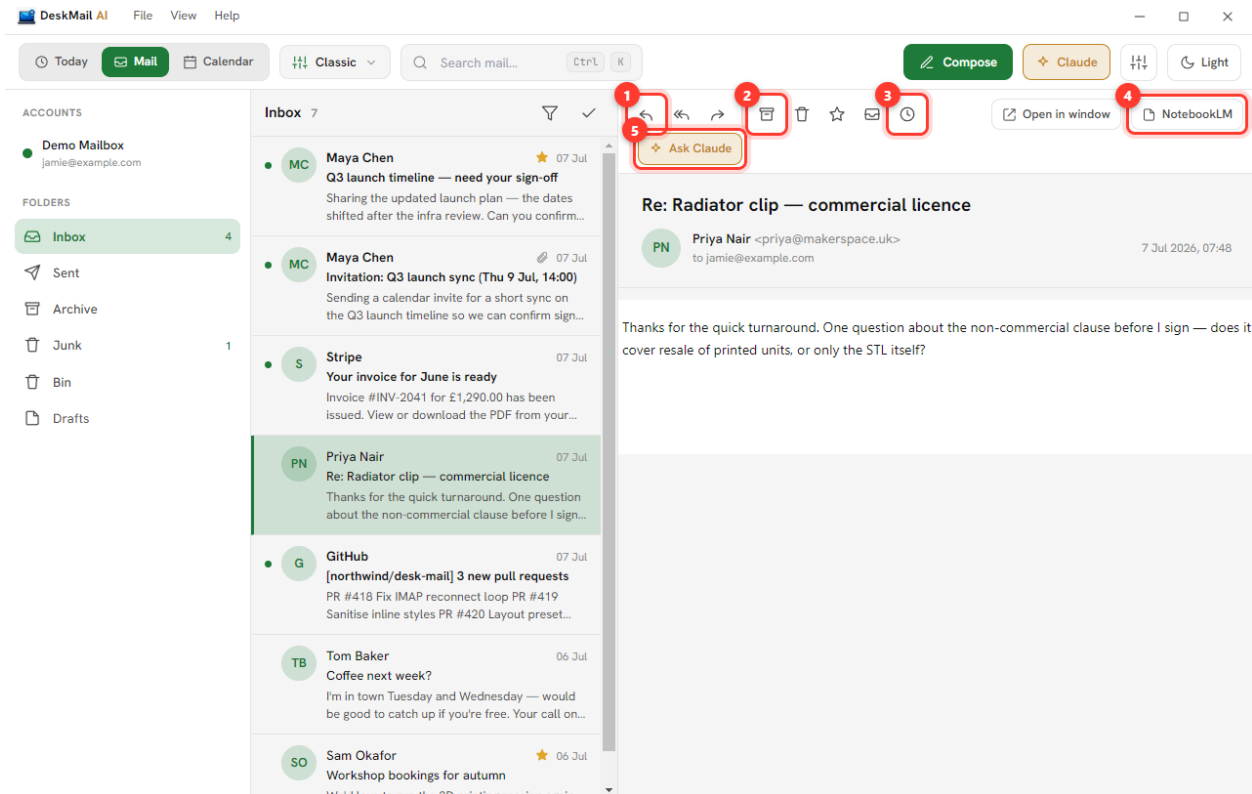

- 1 Outgoing (SMTP) server
- 2 Test the outgoing connection
- 3 Username (usually your email)
- 4 Password (or an app password)
- 5 Save the account

Tip: for Gmail, Outlook.com and iCloud you usually need an “app password” (generated in the provider’s security settings) rather than your normal password, because of two-factor authentication. Your password is encrypted by Windows and never stored in plain text.

3 · Reading & organising mail

Click a message to read it; double-click to open it in its own window. Remote images are blocked by default to stop senders tracking you — click “Load images” if you trust the sender.

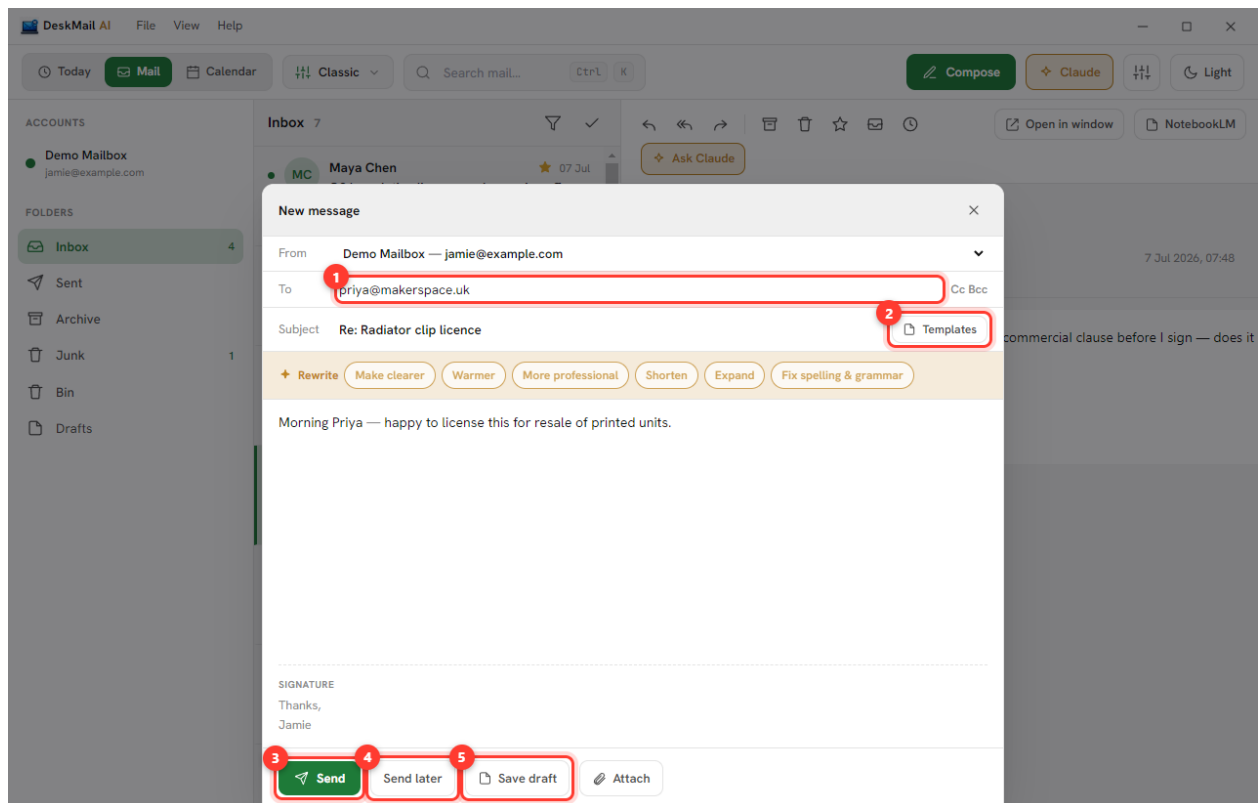

- 1 Reply / Reply all / Forward
- 2 Archive · Delete · Star · Mark unread
- 3 Snooze (hide until later)
- 4 Export this email for NotebookLM
- 5 Ask Claude about this email

Archive, delete (moves to Bin — reversible), star, mark unread, or snooze a message to hide it until later. Actions apply straight away and are pushed to your mail server.

4 · Writing email

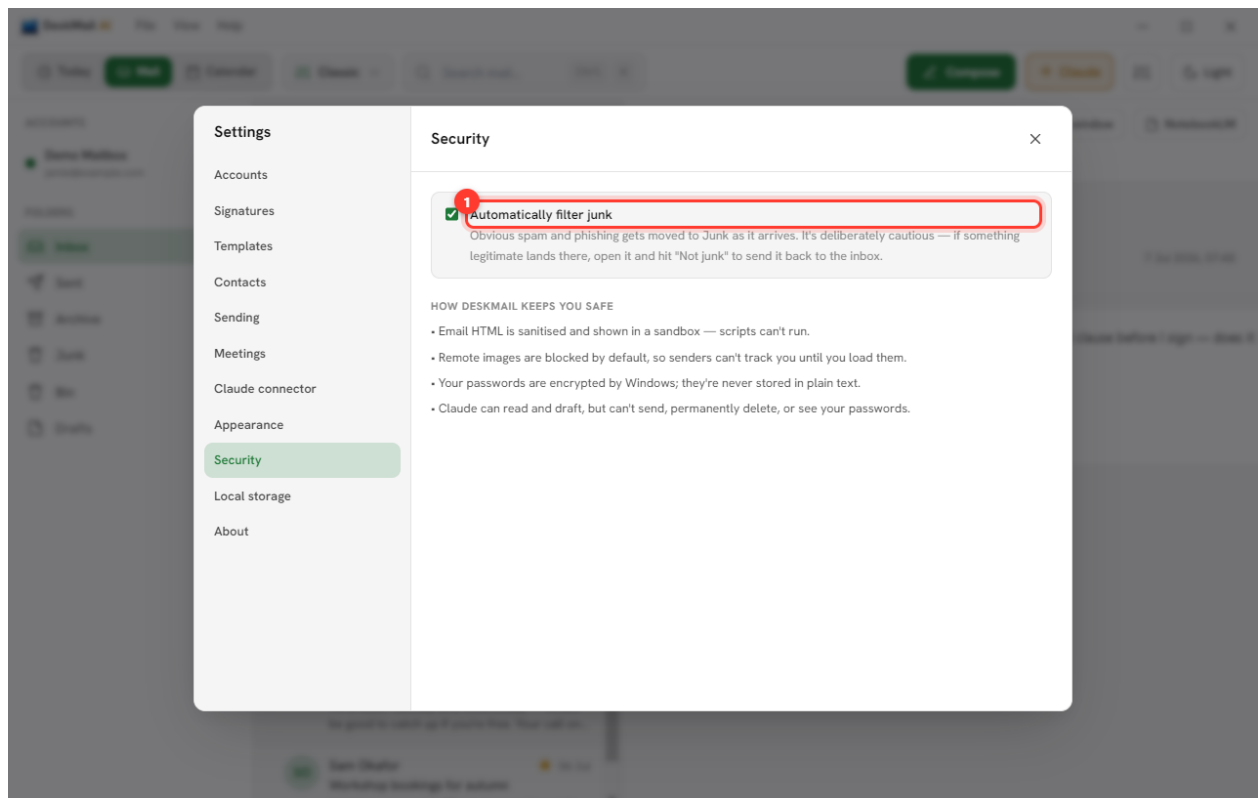

Click Compose. Add recipients, a subject and your message. You can insert a saved template, attach files, and either send now (with a short undo window) or schedule it for later. Your signature is added automatically.

- 1 To (with Cc / Bcc)
- 2 Insert a saved reply template
- 3 Send now (with an undo window)
- 4 Schedule for later
- 5 Save as a draft

5 · Junk filtering

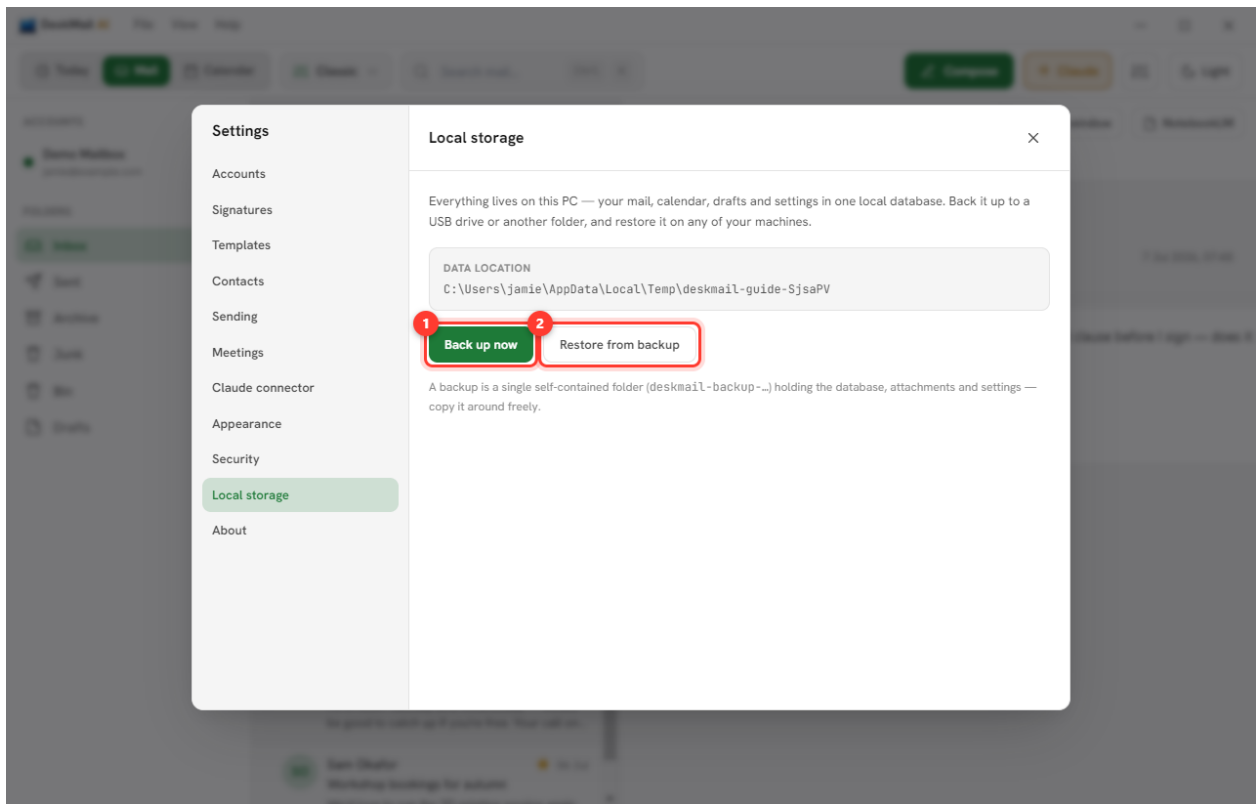

Obvious spam is moved to Junk automatically. It's deliberately cautious; if something legitimate lands there, open it and click "Not junk". You can turn the filter on or off in Settings !' Security.

- 1 Turn the junk filter on/off

6 · Backing up & moving to a new PC

In Settings !' Local storage, “Back up now” copies your whole mailbox — the database, attachments and settings — into a single dated folder you can put on a USB drive. On a new machine, install DeskMail, then use “Restore from backup”. You’ll re-enter each account’s password once (Windows ties saved passwords to a specific PC).

- 1 Back up the whole mailbox to a folder
- 2 Restore from a backup

Also keep a copy of the installer (DeskMail AI-0.1.0-setup.exe) on the same USB drive so you can reinstall the app itself.
